

Q1. Blood is carried away from the heart by the arteries. The largest artery is the aorta, which leaves the left ventricle of the heart.

Q3. Chloroplasts contain the pigment chlorophyll, which absorbs light energy. Photosynthesis happens in two stages, the light dependent reactions and the Calvin cycle, which fixes carbon dioxide into sugars.

Q2. The chloroplast is the organelle mainly involved in photosynthesis.

Q11 (a) Plant A has broad green leaves because it gets bright light. Plant B is etiolated, with pale elongated leaves, because it grew in dim light.

Q11 (b) Move Plant B into bright sunlight for a few hours each day, and water it regularly so that

new leaves can grow broader and greener over the next two weeks.

Q14. Osmosis makes an animal cell swell and burst when it is placed into pure water.

Q5. Diagram of an alveolus. The alveolar sac is wrapped in a capillary network. Oxygen diffuses into the blood and carbon dioxide diffuses out.
